

PORT COLLAR

This Port Collar provides a means of opening a flow path through the casing string at any time after a well is completed. The flow path can be re-closed later and the procedure repeated as often as required. Port Collars are run at strategic points in the casing string, then used later for a variety of applications, including: planned or unexpected stage cementing operations, selective production, and integrity testing.

Kline Port Collars are full-opening whether used or not, and no drill-out is necessary after stage cementing through them. They are shifted open or closed rotationally, using a Kline Mechanical Collar Locator. This allows for simple selective locating of each port collar and doesn't require stocking an expensive single-purpose shifting tool. The rotation required to shift the sleeve is normally left to open and right to close, but can be easily reversed, if desired, prior to running the casing.

SIZE	ID	OD
4 1/2	4.00	5.50
5 1/2	5.00	6.50
7	6.50	8.00

All dimensions listed in inches.
