

PRESSURE BALANCED EQUALIZING VALVE

The Pressure Balanced Equalizing Valve is designed to permit certain packers to run as solid element bridge plugs.

With this equalizing valve attached, a mechanically set locking packer can be left in the well to serve as a bridge plug during remedial operations. The pressure balanced valve is then opened prior to retrieval, allowing differential pressure to be equalized before the packer is released.

An Overshot is available that is used to run and retrieve the Pressure Balanced Equalizing Valve.

SIZE	CONNECTIONS (Box x Pin std)	OVERSHOT OD*	OVERSHOT ID
2 3/8	2 3/8 EU8Rd	3.75	2.00
2 7/8	2 7/8 EU8Rd	4.50	2.50

All dimensions listed in inches.

**This is the smallest OD available.*

With different bottom shoes the OD can be increased to be compatible with larger casing.
